Green Patch in Your Brownfield

What's a "BROWNFIELD"?

A decades-old manufacturing facility with legacy systems that are not networked & can't communicate with each other.
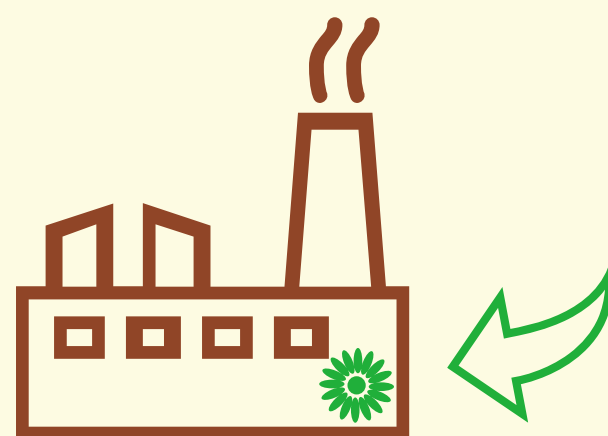

Greenfields...

A factory built from the ground up, these are usually cost probitive.
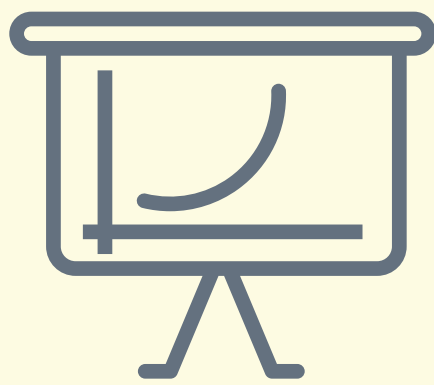

BUT, there is an alternative...

Green PATCHES!

Using the "factory within a factory" principle, you make an IIoT investment inside an existing facility.
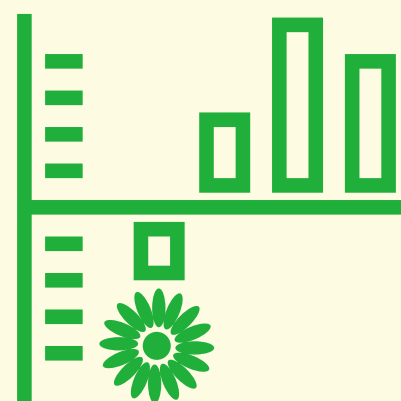

Results!

By focusing on a single new line or cell, initial deployment of IIoT technology is much easier and can later be scaled.
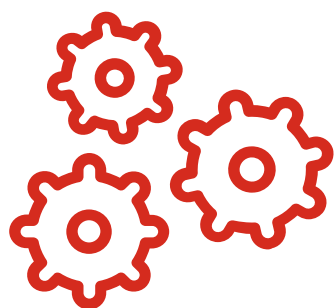

Consider...

A project of manageable scope that can be effectively self-contained and operate independently from the rest of the factory.

Green is the new brown!

The green patch approach is a manageable, measureable proof-of-concept project that allows for testing before scaling up.
