

测试床:工业互联网创新解决方案实践者 Concept of Testbed: from the idea to implementation

ZHOU YALING, HUAWEI Nov. 2018 BEIJING 4 5926 4 6 A7 8 0 E BF3 14 **Opportunities and Challenges**: the market is fast paced, but still in pilot stage and slowly revealing its true value 机遇与挑战:产业节奏在加速,但仍处于大规模试点阶段

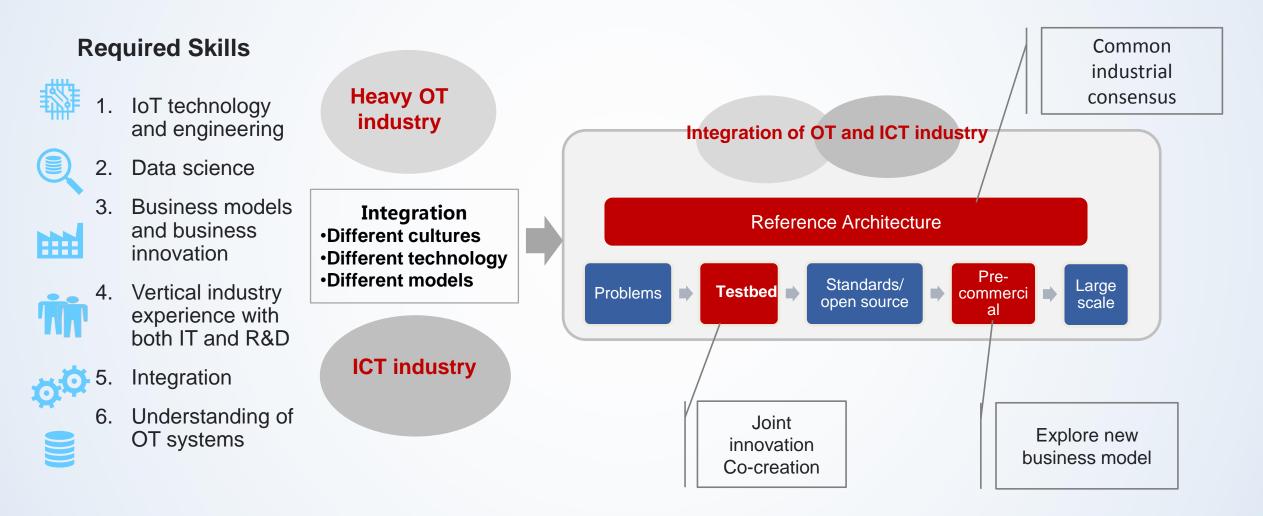

">70% of IoT initiatives are still in the POC/pilot stage"

"By 2022, IoT - enabled service models could save a trillion dollars a year in maintenance and service costs."

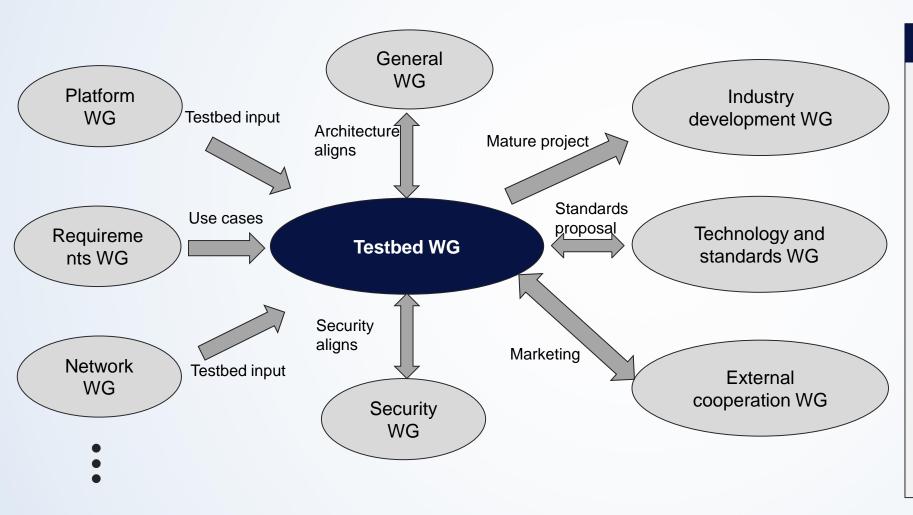

From: Gartner

All industries are struggling, Must **Integrate** Many Technologies and cultures, to make use of different models and ecosystem OT与ICT融合加速,需要新的产业发展模式,测试床是关键

Overview of testbed in All: **Collaboration** and Joint Innovation, from idea to implementation AII测试床概览:协同和联合创新,从概念到产业落地的探索过程

Scope

- Explore best practices and promote demonstration
- Form a replicable innovative project with partners
- Manage the testbed to drive common testbed set
- Promote the Chinese standards
- International best
 practices collaboration

45 testbeds have been initiated, the platform and new network testbeds account for the largest proportion 已经立项45个测试床,从创新上看平台、新型网络及应用类测试床占比最大,人工智能等新兴技术在逐步增多

Industrial Internet Platform (14)

Smart factory/service Driven by industrial internet (8)

New technology (8) AI、EC、bigdata、 Block Chain...

New network & application (15) TSN、industrial PON、 NB-IOT.. Collaborative manufacturing platform for small and medium-sized enterprises

Remote health management of wind turbines based on XSOM industrial internet platform

Industrial APP platform test bed based on intelligent numerical control system

Predictive maintenance test bed

Digital factory test bed based on industrial network connection

Industrial Internet private network test bed based on SDN and SDP

Equipment remote monitoring and diagnosis test bed based on industrial internet platform

Flexible detection scheme for Industrial product appearance based on visual intelligence

Real-time detection and optimization of product quality based on 5G and artificial intelligence

NB-IoT shared washing machine test bed

ROS robot wireless general platform test bed

Latest 11 Test beds

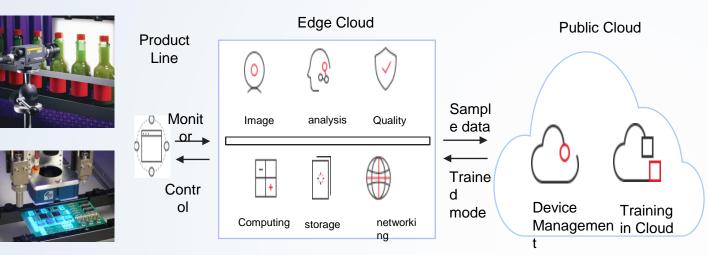

Verticals aspect: discrete manufacturing move fast, horizontal testbeds create more value for the industry 从垂直行业看主要集中在离散制造业,基础共性测试床优秀比例最高

	Industrial Internet Networking Horizontal Testbed Intelligent security real-time industrial network system based on ultra edge computing Product life-cycle Management Testbed based on heterogeneous identification technology
Horizontal	The Critical Technology Validation and Application for CPS Blockchain-based industrial data connection testbed Industrial wide broadband Internet testbed in WAN
	Blockchain-based product quality credible traceability system Collaborative Manufacturing Platform
	_TSN Network Testbed for OT-IT Convergence
	Manufacturing Quality Management Testbed Testbed of cloud manufacturing service platform Testbed of smart factory based on safe and controllable cloud platform Intelligent Service Platform
Manufacturing	DiscreteIndustrial Network Interconnection and Data Acquisition Testbed Software Defined Reconfigurable Intelligent Manufacturing Testbed Industrial IoT Enabled Smart Factory for TelecommunicationRemote Monitoring and Diagnosis Digital Chemical Factory Based on Industrial Network ConnectionSmart electronic product manufacturing testbed Testbed of Fault Detection based on Industrial Robot Factory Intelligent Manufacturing Efficiency Improvement Testbed based on eLTE SolutionROS Robot Wireless Universal Platform Remote Health Management of Fan Remote Health Management of Fan Remote Health Management of product quality
	- process — ProMACE [®] — Intelligent Manufacturing Industrial Cloud for Process Industry
Utility —	Industrial Internet Private Network Based on SDN and SDP WPG Intelligent Urban Water Supply Testbed NB-IoT Water Meter Testbed NB-IoT Smart Lighting NB-IoT shared washing machine
Healthcare —	Aibed The elderly Home Care Project
logistics —	— Harbor Automatic transmission System

Alliance of Industrial Internet

Visual Intelligent Industrial Product Appearance Flexible Detection Testbed 基于视觉智能工业品外观柔性检测测试床

Partner	Role
Huawei	Edge detection hardware devices. and public cloud training platform.
Foxconn	Film sample data and detection standards. the testbed related production and test environment.
intellifusion	Image detection algorithms and model and train the objects to be detected.
Hikvision	Devices such as industrial cameras and light sources, and collects PU images.
SoftStone	system integration and large-scale replication

- **Challenges and object**: The detection of industrial film products is based on artificial, detection by eyes and experience, low detection efficiency, high training cost, and missing detection. In this testbed, industrial film detection is manually upgraded to automation. The architecture and AI algorithm are used for innovation, which can be replicated in similar scenarios at low costs.
- **Expected**: Fully intelligent detection, detection rate 100%, detection speed matching production speed;
- **Innovation**: Introduce the AI technology to build a complete and replicable detection system based on the industrial cloud platform and device-cloud synergy.

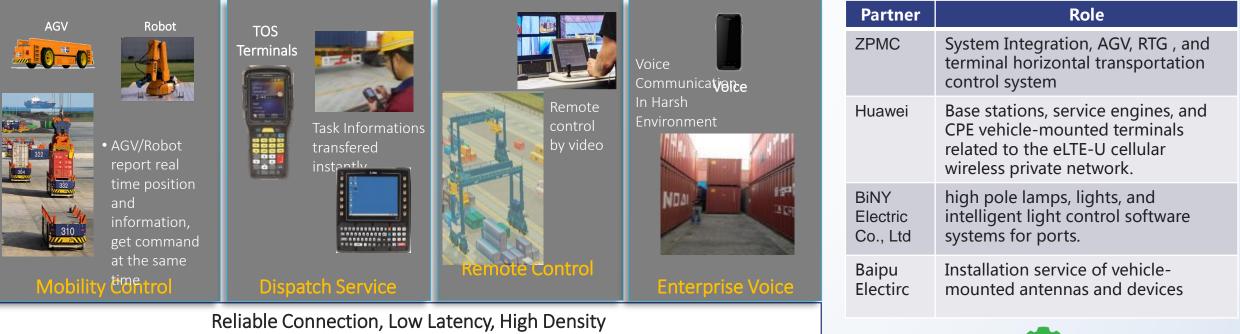

Phase Plan:

- Phase 1: Foxconn production line inspection and requirement extraction
- Phase 2: Data modeling and analysis Key algorithm design and effect simulation.
- Phase 3: Testbed design and development, and onsite commissioning
- Phase 4: Test and promote the effect of the real production line.
- Current Progress and Next Steps: Complete the Foxconn factory survey and requirements. Obtain the film product image and construct the AI algorithm sample library. Next, optimize and train algorithms to design a complete solution.

Port industrial wireless automation platform Testbed 港口无线自动化平台测试床

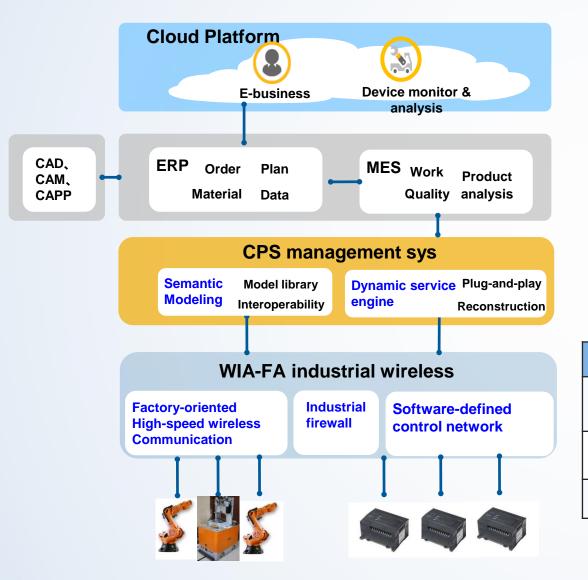

- Challenges: The dispatching bank bridges, field bridges, trailers, and heavy forklifts of the central control room need to work together and monitor the operation progress in real time. Traditional connectivity is unreliable and the bandwidth is insufficient, which affects the security and throughput of terminal services and cannot carry the AGV unmanned communication bearer.
- **Objectives and innovation**: The testbed meet the service requirements of the port automation AGV horizontal transportation system in terms of end-to-end delay, service capacity, and coverage capability through the field networking and test of the port wireless automation testbed. With the big data, artificial intelligence, and new high-reliability industrial wireless interconnection technology, to improve the production efficiency of the wharf, reduce the cost of manpower maintenance. It provides an example of intelligent service management systems for automatic warehousing and large-scale industrial parks (such as steel mills, shipyards, and oil and gas parks) and industrial wireless networks with high reliability and low latency.

lliance of Industrial Internet

Broadband + Narrowband + Voice

Software-defined, reconfigurable, intelligent manufacturing 软件定义的可重构智能制造

Architecture:

- Cloud-based enterprise and shop floor management software and service system
- Design and development platform
- CPs intelligent management and control system
- WIA based smart factory full-mesh network
- Reconfigurable modular processing and assembly system
 Testbed results:
- 100 ms adaptive reassembling of the network; model and rule combination delay in hundreds of milliseconds
- The device availability time is improved by 30%.
- The structure and control procedures of the production system are adjusted according to the changes of products and production requirements. The period is shortened by 60%.

Partner	Role
Shenyang Automation Institute	Industrial SDN, China Industrial Firewall, and CPS Intelligent Control Software
CIACT	Verify the architecture design, case analysis, and the demonstration platform.
SAP china	HANA platform, Hybris e-commerce platform、ERP、MES、PCO

我们的愿景和使命 把数字世界带入每个人、每个家庭、每个组织, 构建万物互联的智能世界。 Bring digital to every person, home, and organization for a fully connected, intelligent world.
